DOMINION

About Dominion

Dominion is an integral services and projects company headquartered in Spain with more than 1,000 clients across 35 countries. The company has over 10,000 employees and a yearly turnover of +1B euros.

At Dominion one of their mottos is:

"We are and do sustainability".

Their strong commitment to addressing environmental, social and governance (ESG) aspects combined with their objective of offering the best solutions that increase efficiency through the application of technology is what led them to become one of APlanet's first clients.

The Challenge

As a publicly listed company, Dominion began to face challenges with respect to the volume of non-financial information they were being required to report due to the European Union's toughening of the Corporate Sustainability Reporting Directive (then called Non Financial Reporting Directive).

In addition, as a company committed to sustainability for themselves and their customers, they wanted to find an easy way to unify information that was often scattered between departments and in many cases overlapping.

After 2 years of managing their non-financial information and ESG aspects manually, from the Risk and Compliance division, the company set out to invest in improving their internal processes around how they collected and managed all the relevant data around their sustainability.

The Challenge

The main objectives set out to address this challenge were:

- To better respond to evolving requirements around sustainability disclosures, especially regarding environmental and climate related aspects such as their carbon footprint.
- To improve the traceability of their sustainability data across their complex organisational structure and facilitate the information auditing process.
- To increase the efficiency and reduce administrative burdens surrounding the information collection and reporting process across the organisation.
- To leverage the sustainability reporting process to extract more value from their data and inform their sustainability strategy.

The Solution

Since using APlanet, Dominion has been able to successfully unify all their non-financial data in one place.

Using the platform has allowed them to not only **automate their data collection** and **manage their sustainability information in a more user-friendly way**, but it has also given the company a better understanding of how their information should be organised and shared across their complex organisational structure.

The Solution

Other significant benefits that Dominion has seen since using APlanet include:

- Increased reporting capabilities as they can now report a larger and more precise volume of information.
- Elimination of human errors in the sustainability data management and reporting process.
- Improved scope 1, scope 2, and scope 3 emissions calculations.
- More agile and user friendly auditing process thanks to the auditor features.

Quotes

“The amount of information we are able to manage and report in any given time has increased significantly.”

“It is giving us the opportunity to interact much more on sustainability issues with stakeholders from different divisions within the organisation.”

“We now know exactly who has the information and how to structure it. The platform has allowed us to unify concepts and permeate them from the top-down.”

—— Gabriela Martin, **Global Risk and Compliance at Dominion**
